100 mm (10 cm)

If the calibration line above measures 100 mm (10 cm) in length, view the chart from a distance of twenty feet. If the line is longer or shorter than 100 mm, stand correspondingly further away or closer to the chart. Test one eye at a time by covering the other eye. Attempt to determine the direction each letter E is pointing in each successive line. The smallest line which can be read approximates visual acuity. Not for diagnostic purposes. For educational and entertainment use only. To determine your actual acuity and state of health see a physician.
